SUMMARY OF APRIL 2024 POPULATION MONITORING

The April 2024 population monitoring efforts were conducted at the 20 standard sites and 20 additional sites. We sampled the ten old additional sites, along with ten new additional sites, during April 2024. Ten sites were in the Angostura Reach, fourteen sites were in the Isleta Reach, and sixteen sites were in the San Acacia Reach. For the 2024 monthly trends, data were based on all sites (i.e., standard, additional, and replacement sites) to maintain consistency across all monthly reports. A list of all collection localities is appended (Appendix A). Adult and juvenile fish were obtained by rapidly drawing a 3.0 m x 1.8 m small-mesh (ca. 5 mm) seine through discrete mesohabitats. Larval fish were collected with a 1.2 m x 1.2 m fine-mesh (ca. 1 mm) seine. All fishes were identified to species and enumerated. We used length-age relationships to assign ages (i.e., age-0, age-1, and age-2+) to all Rio Grande Silvery Minnow collected. Age-0 individuals are only present, however, after seasonal spawning events that typically first occur during spring runoff. Figures illustrating fish densities (i.e., fish per 100 m²) were prepared for the ten focal species to facilitate comparisons across reaches.

Angostura Reach

From 16 March to 15 April, provisional U.S. Geological Survey (USGS) mean daily discharge in the Angostura Reach (Albuquerque: USGS Gage-08330000) averaged 600 ft³/s and ranged from 499 to 758 ft³/s. Water temperatures ranged from 10.0 to 18.6 °C during the Angostura Reach sampling efforts (ca. 0830–1500 h). Secchi disk measurements of water clarity ranged from 8 to 71 cm.

Sampling for fishes in the Angostura Reach during April yielded 591 individuals with a cumulative fish density of 11.5 individuals per 100 m² sampled. The overall sampling effort in the Angostura Reach covered 5,153.6 m² (surface area) of water. Densities of all fish species combined ranged from 2.0 to 28.2 individuals per 100 m² at the different sampling sites. In April, there were 10 fish species collected in the Angostura Reach. Red Shiner was the most abundant taxon (n = 307), followed by Flathead Chub (n = 160), and Rio Grande Silvery Minnow (n = 72). We collected Rio Grande Silvery Minnow (n = 72) in 39 of the 123 seine hauls that yielded fish, and its overall density was 1.40 (range = 0.00–3.89) individuals per 100 m².

Isleta Reach

Provisional mean daily discharge in the Isleta Reach (Bosque Farms: USGS Gage-08331160), from 16 March to 15 April, averaged 429 ft³/s and ranged from 240 to 548 ft³/s. During the Isleta Reach sampling efforts (ca. 0930–1600 h), water temperatures ranged from 11.4 to 18.7 °C. Secchi disk measurements ranged from 9 to 14 cm during sampling.

Isleta Reach population monitoring efforts produced 1,004 individuals in April with a cumulative fish density of 15.4 individuals per 100 m² sampled. The total sampling effort in the Isleta Reach during April covered 6,538.4 m² (surface area) of water. Fish densities (all species combined) at the sampling sites ranged from 0.0 to 29.6 individuals per 100 m² sampled. There were 10 fish species collected in the Isleta Reach during April. Red Shiner was the most abundant taxon (n = 792), followed by Rio Grande Silvery Minnow (n = 119), and Common Carp (n = 32). We collected Rio Grande Silvery Minnow (n = 119) in 59 of the 159 seine hauls that yielded fish, and its overall density was 1.82 (range = 0.00–10.64) individuals per 100 m².

San Acacia Reach

From 16 March to 15 April, provisional mean daily discharge at San Acacia (USGS Gage-08354900) was generally higher (average = 504; range = 232–674 ft³/s) than at San Marcial (USGS Gage-08358400) during the same period (average = 360; range = 235–487 ft³/s). Water temperatures in April for the San Acacia Reach ranged from 11.1 to 14.2 °C (ca. 0930–1600 h). Secchi disk measurements ranged from 7 to 13 cm during sampling.

Population monitoring efforts in the San Acacia Reach during April yielded 970 individuals with a cumulative fish density of 11.9 individuals per 100 m² sampled. Sampling in the San Acacia Reach covered an area of 8,124.0 m² of water. Fish densities (all species combined) ranged from 1.1 to 37.6 individuals per 100 m² at sites sampled in the San Acacia Reach. In April, there were 12 fish species collected in the San Acacia Reach. Red Shiner was the most abundant taxon (n = 501), followed by Rio Grande Silvery Minnow (n = 284), and Channel Catfish (n = 84). We collected Rio Grande Silvery Minnow (n = 284) in 95 of the 175 seine hauls that yielded fish, and its overall density was 3.50 (range = 0.54–17.73) individuals per 100 m².
