## SUMMARY OF APRIL 2018 POPULATION MONITORING

The April population monitoring efforts were conducted at the 20 standard sites and at 10 additional sites. Ten sites were located in each of the three sampling reaches: Angostura, Isleta, and San Acacia. The Middle Rio Grande Endangered Species Collaborative Program requested that the additional sampling be conducted once in the spring and fall of each year. **While this report follows the typical monthly report format, key changes to the text, tables, and figures are highlighted in bold-italic font. For April 2018, comparisons were made between standard sites and all sites (i.e., standard plus additional sites). For the 2018 monthly trends, data were based on all sites (i.e., standard, additional, and replacement sites) to maintain consistency across all monthly reports.** A list of all collection localities is appended (Appendix A). Adult and juvenile fish were obtained by rapidly drawing a 3.1 m x 1.8 m small mesh (ca. 5 mm) seine through discrete mesohabitats. Larval fish were also collected with a 1.0 m x 1.0 m fine mesh (ca. 1.5 mm) seine. All fishes were identified to species and enumerated. We used length-age relationships to assign ages (i.e., age-0, age-1, and age-2+) to all Rio Grande Silvery Minnow collected. Age-0 individuals are, however, only present after annual spring spawning occurs (ca. April–June). Figures illustrating fish densities (i.e., fish per 100 m<sup>2</sup>) were prepared for the ten focal species to facilitate comparisons across reaches.

### Angostura Reach

**Mean daily discharge in the Angostura Reach (Rio Grande at Albuquerque, NM; USGS Gage 08330000) averaged 436.6 and ranged from 380 to 507 cfs from 16 March to 15 April. Water temperatures ranged from 10.5 to 19.2 °C during the Angostura Reach sampling efforts (ca. 0830–1530 h). Secchi disk measurements of water clarity ranged from 30 to 100 cm.**

**Sampling for fishes in the Angostura Reach during April yielded 568 individuals with a cumulative fish density of 10.8 individuals/100 m<sup>2</sup> sampled. The overall sampling effort in the Angostura Reach covered 5,239.9 m<sup>2</sup> (surface area) of water. Densities of all fish species combined ranged from 0.5 to 57.2 individuals per 100 m<sup>2</sup> at the different sampling sites. In April, there were 8 fish species collected in the Angostura Reach. Red Shiner was the most abundant taxon ( $n = 443$ ), followed by Rio Grande Silvery Minnow ( $n = 54$ ), and Flathead Chub ( $n = 36$ ). Densities of Rio Grande Silvery Minnow ranged from 0.0 to 3.5 individuals per 100 m<sup>2</sup>. Rio Grande Silvery Minnow ( $n = 54$ ) was present in 24 of the 84 seine hauls that yielded fish during April.**

### Isleta Reach

**In the Isleta Reach, mean daily discharge (Rio Grande at Isleta Lakes near Isleta, NM; USGS Gage 08354900) averaged 373.4 and ranged from 298 to 452 cfs from 16 March to 15 April. Water temperatures ranged from 11.2 to 20.6 °C throughout the sampling localities during the day (ca. 0930–1600 h). Secchi disk measurements ranged from 24 to 34 cm during sampling.**

**Isleta Reach population monitoring efforts produced 2,127 individuals in April with a cumulative fish density of 43.2 individuals/100 m<sup>2</sup> sampled. The total sampling effort in the Isleta Reach during April covered 4,924.7 m<sup>2</sup> (surface area) of water. Fish densities (all species combined) at the sampling sites ranged from 6.7 to 142.2 individuals per 100 m<sup>2</sup> sampled. There were 10 fish species collected in the Isleta Reach during April. Red Shiner was the most abundant taxon ( $n = 1,851$ ), followed by Rio Grande Silvery Minnow ( $n = 230$ ), and Flathead Chub ( $n = 17$ ). Densities of Rio Grande Silvery Minnow ranged from 0.0 to 23.6 individuals per 100 m<sup>2</sup>. Rio Grande Silvery Minnow ( $n = 230$ ) was present in 31 of the 117 seine hauls that yielded fish during April.**

### **San Acacia Reach**

*Mean daily discharge at San Acacia (Rio Grande Floodway at San Acacia, NM; USGS Gage 08354900) from 16 March to 15 April was generally higher (average = 147.9; range = 74–315 cfs) as compared to San Marcial (Rio Grande Floodway at San Marcial, NM; USGS Gage 08358400) during the same period (average = 40.6; range = 10–124 cfs). Water temperatures in April for the San Acacia Reach ranged from 13.1 to 22.2 °C (ca. 0930–1600 h). Water clarity was generally lower in this reach (Secchi disk range = 9–70 cm) compared to the two upstream reaches.*

*Population monitoring efforts in the San Acacia Reach during April yielded 705 individuals with a cumulative fish density of 13.6 individuals per 100 m<sup>2</sup> sampled. Sampling in the San Acacia Reach covered an area of 5,179.9 m<sup>2</sup> of water. Fish densities (all species combined) ranged from 3.7 to 35.9 individuals per 100 m<sup>2</sup> at sites sampled in the San Acacia Reach. In April, there were 9 fish species collected in the San Acacia Reach. Red Shiner was the most abundant taxon (n = 485), followed by Rio Grande Silvery Minnow (n = 143), and Flathead Chub (n = 39). Densities of Rio Grande Silvery Minnow ranged from 0.0 to 9.7 individuals per 100 m<sup>2</sup>. Rio Grande Silvery Minnow (n = 143) was present in 52 of the 119 seine hauls that yielded fish during April.*

#### **Standard Sites (n = 20)**

During April, sampling covered 10,269.1 m<sup>2</sup> (surface area) of water and yielded 1,731 fish. There were no dry sampling sites. Cumulative fish density during April was 16.86 individuals/100 m<sup>2</sup> sampled. The three most common species were Red Shiner (n = 1,349), Rio Grande Silvery Minnow (n = 269), and Flathead Chub (n = 44). The sampling sites yielded a total of 15 fish species. Rio Grande Silvery Minnow was present in 69 of the 201 seine hauls that yielded fish. We collected Rio Grande Silvery Minnow at 14 of the 20 sampling sites, and its overall density was 2.62 (n = 269) individuals/100 m<sup>2</sup> sampled. Densities of unmarked and marked individuals were 2.61 (n = 268) and 0.01 (n = 1) individuals/100 m<sup>2</sup> sampled, respectively. Densities of age-0, age-1, and age-2+ individuals were 0.00 (n = 0), 2.53 (n = 260), and 0.09 (n = 9) individuals/100 m<sup>2</sup> sampled, respectively.

#### **All Sites (n = 30)**

*During April, sampling covered 15,344.4 m<sup>2</sup> (surface area) of water and yielded 3,400 fish. There were no dry sampling sites. Cumulative fish density during April was 22.16 individuals/100 m<sup>2</sup> sampled. The three most common species were Red Shiner (n = 2,779), Rio Grande Silvery Minnow (n = 427), and Flathead Chub (n = 92). The sampling sites yielded a total of 15 fish species. Rio Grande Silvery Minnow was present in 107 of the 320 seine hauls that yielded fish. We collected Rio Grande Silvery Minnow at 24 of the 30 sampling sites, and its overall density was 2.78 (n = 427) individuals/100 m<sup>2</sup> sampled. Densities of unmarked and marked individuals were 2.77 (n = 425) and 0.01 (n = 2) individuals/100 m<sup>2</sup> sampled, respectively. Densities of age-0, age-1, and age-2+ individuals were 0.00 (n = 0), 2.68 (n = 411), and 0.10 (n = 16) individuals/100 m<sup>2</sup> sampled, respectively.*
