## SUMMARY OF JUNE 2023 POPULATION MONITORING

The June 2023 population monitoring efforts were conducted at the 20 standard sites. Five sites were in the Angostura Reach, six sites were in the Isleta Reach, and nine sites were in the San Acacia Reach. For the 2023 monthly trends, data were based on all sites (i.e., standard, additional, and replacement sites) to maintain consistency across all monthly reports. A list of all collection localities is appended (Appendix A). Adult and juvenile fish were obtained by rapidly drawing a 3.0 m x 1.8 m small-mesh (ca. 5 mm) seine through discrete mesohabitats. Larval fish were collected with a 1.2 m x 1.2 m fine-mesh (ca. 1 mm) seine. All fishes were identified to species and enumerated. We used length-age relationships to assign ages (i.e., age-0, age-1, and age-2+) to all Rio Grande Silvery Minnow collected. Age-0 individuals are only present, however, after annual spring spawning (ca. April–June). Figures illustrating fish densities (i.e., fish per 100 m<sup>2</sup>) were prepared for the ten focal species to facilitate comparisons across reaches.

### ***Angostura Reach***

From 16 May to 15 June, provisional U.S. Geological Survey (USGS) mean daily discharge in the Angostura Reach (Albuquerque: USGS Gage-08330000) averaged 4,366 ft<sup>3</sup>/s and ranged from 4,080 to 4,730 ft<sup>3</sup>/s. Water temperatures ranged from 16.9 to 17.9 °C during the Angostura Reach sampling efforts (ca. 0830–1530 h). Secchi disk measurements of water clarity ranged from 11 to 25 cm.

Sampling for fishes in the Angostura Reach during June yielded 257 individuals with a cumulative fish density of 14.1 individuals per 100 m<sup>2</sup> sampled. The overall sampling effort in the Angostura Reach covered 1,824.3 m<sup>2</sup> (surface area) of water. Densities of all fish species combined ranged from 2.6 to 23.2 individuals per 100 m<sup>2</sup> at the different sampling sites. In June, there were 10 fish species collected in the Angostura Reach. Rio Grande Silvery Minnow was the most abundant taxon (n = 65), followed by White Sucker (n = 53), and Flathead Chub (n = 49). We collected Rio Grande Silvery Minnow (n = 65) in 3 of the 39 seine hauls that yielded fish, and its overall density was 3.56 (range = 0.00–12.08) individuals per 100 m<sup>2</sup>.

### ***Isleta Reach***

Provisional mean daily discharge in the Isleta Reach (Bosque Farms: USGS Gage-08331160), from 16 May to 15 June, averaged 4,438 ft<sup>3</sup>/s and ranged from 4,130 to 4,650 ft<sup>3</sup>/s. During the Isleta Reach sampling efforts (ca. 0930–1600 h), water temperatures ranged from 18.8 to 29.9 °C. Secchi disk measurements ranged from 11 to 16 cm during sampling.

Isleta Reach population monitoring efforts produced 254 individuals in June with a cumulative fish density of 13.8 individuals per 100 m<sup>2</sup> sampled. The total sampling effort in the Isleta Reach during June covered 1,845.5 m<sup>2</sup> (surface area) of water. Fish densities (all species combined) at the sampling sites ranged from 0.4 to 41.7 individuals per 100 m<sup>2</sup> sampled. There were 9 fish species collected in the Isleta Reach during June. Common Carp was the most abundant taxon (n = 175), followed by Red Shiner (n = 44), and Rio Grande Silvery Minnow (n = 16). We collected Rio Grande Silvery Minnow (n = 16) in 8 of the 41 seine hauls that yielded fish, and its overall density was 0.87 (range = 0.00–2.18) individuals per 100 m<sup>2</sup>.

---

### ***San Acacia Reach***

From 16 May to 15 June, provisional mean daily discharge at San Acacia (USGS Gage-08354900) was generally higher (average = 4,019; range = 3,680–4,350 ft<sup>3</sup>/s) than at San Marcial (USGS Gage-08358400) during the same period (average = 3,624; range = 3,370–3,790 ft<sup>3</sup>/s). Water temperatures in June for the San Acacia Reach ranged from 19.9 to 22.5 °C (ca. 0930–1600 h). Secchi disk measurements ranged from 6 to 26 cm during sampling.

Population monitoring efforts in the San Acacia Reach during June yielded 162 individuals with a cumulative fish density of 5.4 individuals per 100 m<sup>2</sup> sampled. Sampling in the San Acacia Reach covered an area of 2,984.3 m<sup>2</sup> of water. Fish densities (all species combined) ranged from 0.4 to 14.6 individuals per 100 m<sup>2</sup> at sites sampled in the San Acacia Reach. In June, there were 10 fish species collected in the San Acacia Reach. Common Carp was the most abundant taxon (n = 51), followed by Rio Grande Silvery Minnow (n = 49), and Red Shiner (n = 19). We collected Rio Grande Silvery Minnow (n = 49) in 7 of the 40 seine hauls that yielded fish, and its overall density was 1.64 (range = 0.00–6.30) individuals per 100 m<sup>2</sup>.

### ***All Sites***

During June, sampling covered 6,654.0 m<sup>2</sup> (surface area) of water and yielded 673 fish. There were no dry sampling sites. Cumulative fish density during June was 10.11 individuals per 100 m<sup>2</sup> sampled. The three most common species were Common Carp (n = 258), Rio Grande Silvery Minnow (n = 130), and Red Shiner (n = 101). The sampling sites yielded a total of 14 fish species.

Rio Grande Silvery Minnow was present in 18 of the 120 seine hauls that yielded fish and at 10 of the 20 sampling sites. Densities of unmarked and marked individuals were 1.92 (n = 128) and 0.03 (n = 2) individuals per 100 m<sup>2</sup> sampled, respectively. Densities of age-0, age-1, and age-2+ individuals were 1.91 (n = 127), 0.05 (n = 3), and 0.00 (n = 0) individuals per 100 m<sup>2</sup> sampled, respectively. Based on all June surveys since 1993, the overall density of Rio Grande Silvery Minnow averaged 10.02 (range = 0.07–104.32) individuals per 100 m<sup>2</sup> sampled. During June 2023, its overall density was 1.95 (n = 130) individuals per 100 m<sup>2</sup> sampled.
